Ratings and Reviews Rated 5 out of 5 Abraham Al 12.05.2018 What a great app. I'm an amateur photographer and used to buy pro-level apps, so I was skeptical when I first heard about KeroSoft Photo Creations. But since it's very beginner-friendly and does not require any prior knowledge of computer science, I could not resist buying it. The app is very easy to use and requires minimal effort to edit your photos. It has a host of default templates for different poses and camera angles. You can use your own images for a more customized result. I personally do not use the templates but I did notice that the app automatically recognized my face and even gave me a recommendation of a photo filter. It also has a feature where you can insert a text in the picture using some custom fonts, so you don't have to rely on third-party websites for text editing. I recommend this app to anyone who wants to make their images look more professional. Thank you for reviewing this app. It is great to hear that you love this software and have been satisfied with the results. The very first, and probably most important, consideration when creating a wedding layout is a good, high-quality printer. The quality of a printer can be tested by creating a few test prints and comparing them to see what the difference is. The best quality printers will give you the best results. However, you might also want to consider another factor. Have you ever thought about printing your photos on canvas? Canvas printing is something people often choose for their wedding pictures, and it gives your picture a different look and feel. Digital cameras are, of course, able to produce images that can be uploaded and stored on computers and smartphones, but what if your smartphone gets stolen? Since the thief has full access to your camera's internal memory, photos stored on the device can be easily viewed or even altered, for example using an image editing software. In addition, a mobile phone can easily be used to browse the web. If the thief has full access to the browser, he can access your online banking information and even track your movements on the web. In both cases, your privacy could be compromised. To prevent such situations, it is advised to backup your photos on a computer. As mentioned above, you can easily do that using a digital camera. However, a simple solution for taking your photographs is often not sufficient, because often your camera is connected to a smartphone and it may not be easy to take the pictures with the camera, because it is not always easy to reach the right place to take the photographs. Here is a simple workaround to solve both problems at once: Use your smartphone as a digital camera. You can easily take and edit the images on your smartphone, even if the smartphone is not equipped with an optical viewfinder. Just download and install an image editing software that supports smartphones. Description: A wedding is an event in which two people get married, either legally or religiously.
